2. Discrete Kinetic Theory of Gases

## Discrete Kinetic Theory of Gases

> In discrete kinetic theory, the main idea is that the velocities of the molecules belong to a given set of vectors
> The Boltzmann equation is replaced by a system of partial differential equations
> This system has an interesting mathematical structure (H. Cabannes, Bellomo, Cercignani, Kawashima, ...)
$>$ The discrete models, by their simplicity, help to understand the fundamental problems of rarefied gas dynamics
$>$ The hydrodynamic description of discrete gases is obtained via the Chapman-Enskog expansion

## Discrete kinetic theory: Binary collisions

The particles are identical
The particle velocities belong to a given set of vectors:

$$
\overrightarrow{\mathrm{u}}_{\mathrm{k}}, \mathrm{k}=1,2, \ldots, \mathrm{p}
$$

$N_{k}(\vec{x}, t)$ denotes the number of particles with velocity $\overrightarrow{\mathrm{u}}_{\mathrm{k}}$ (i.e. particle «k ») per unit of volume

Macroscopic quantities

$$
\left\{\begin{array}{l}
\mathrm{n}=\sum_{\mathrm{k}} \mathrm{~N}_{\mathrm{k}} \\
\mathrm{n} \overrightarrow{\mathrm{u}}=\sum_{\mathrm{k}} \mathrm{~N}_{\mathrm{k}} \overrightarrow{\mathrm{u}}_{\mathrm{k}} \\
\mathrm{ne}=\frac{\mathrm{m}}{2} \sum_{\mathrm{k}} \mathrm{~N}_{\mathrm{k}}\left(\overrightarrow{\mathrm{u}}_{\mathrm{k}}-\overrightarrow{\mathrm{u}}\right)^{2}
\end{array}\right.
$$

$$
\left\{\begin{array}{l}
\overrightarrow{\overrightarrow{\mathrm{P}}}=\mathrm{m} \sum_{\mathrm{k}} \mathrm{~N}_{\mathrm{k}}\left(\overrightarrow{\mathrm{u}}_{\mathrm{k}}-\overrightarrow{\mathrm{u}}\right)\left(\overrightarrow{\mathrm{u}}_{\mathrm{k}}-\overrightarrow{\mathrm{u}}\right) \\
\overrightarrow{\mathrm{q}}=\frac{\mathrm{m}}{2} \sum_{\mathrm{k}} \mathrm{~N}_{\mathrm{k}}\left(\overrightarrow{\mathrm{u}}_{\mathrm{k}}-\overrightarrow{\mathrm{u}}\right)^{2}\left(\overrightarrow{\mathrm{u}}_{\mathrm{k}}-\overrightarrow{\mathrm{u}}\right)
\end{array}\right.
$$

## Binary collision

$$
\overrightarrow{\mathrm{u}}_{\mathrm{k}}, \quad \overrightarrow{\mathrm{u}}_{\ell}
$$

After the collision

In the collision, the mass, momentum and energy are conserved
$\underline{\text { Transition probability }} \quad A_{i j}^{\mathrm{k} \ell}$
Microreversibility property $\quad A_{i j}^{\mathrm{k} \ell}=\mathrm{A}_{\mathrm{k} \ell}^{\mathrm{ij}}$

## Discrete kinetic theory: Examples

Spatial models with 6 velocities or with 8 velocities (Broadwell, 1964)

Coplanar models

## Kinetic equations (binary collisions)

$$
\left\{\begin{array}{l}
\frac{\partial}{\partial \mathrm{t}} \mathrm{~N}_{\mathrm{k}}+\overrightarrow{\mathrm{u}}_{\mathrm{k}} \cdot \vec{\nabla} \mathrm{~N}_{\mathrm{k}}=\mathrm{G}_{\mathrm{k}}-\mathrm{L}_{\mathrm{k}}, \quad \mathrm{k}=1,2, \ldots, \mathrm{p} \\
\frac{\partial}{\partial \mathrm{t}} \mathrm{~N}_{\mathrm{k}}+\overrightarrow{\mathrm{u}}_{\mathrm{k}} \cdot \vec{\nabla} \mathrm{~N}_{\mathrm{k}}=\frac{1}{2} \sum_{\mathrm{ij} \ell}\left(\mathrm{~A}_{\mathrm{ij}}^{\mathrm{k} \mathrm{\ell}} \mathrm{~N}_{\mathrm{i}} \mathrm{~N}_{\mathrm{j}}-\mathrm{A}_{\mathrm{k} \ell}^{\mathrm{ij}} \mathrm{~N}_{\mathrm{k}} \mathrm{~N}_{\ell}\right), \quad \mathrm{k}=1,2, \ldots, \mathrm{p}
\end{array}\right.
$$

Notations

$$
\begin{gathered}
\mathbf{N}=\left(\mathrm{N}_{1}, \mathrm{~N}_{2}, \ldots, \mathrm{~N}_{\mathrm{p}}\right) \\
\langle\mathbf{U}, \mathbf{V}\rangle=\sum_{\mathrm{k}} \mathrm{U}_{\mathrm{k}} \mathrm{~V}_{\mathrm{k}}
\end{gathered}
$$

$\mathcal{F}(\mathbf{U}, \mathbf{V}) \quad$ Linear mapping of $\mathrm{R}^{\mathrm{p}} \times \mathrm{R}^{\mathrm{p}}$ into $\mathrm{R}^{\mathrm{p}}$

Kinetic equations

$$
\frac{\partial}{\partial \mathrm{t}} \mathbf{N}+\mathcal{A} \mathbf{N}=\mathcal{F}(\mathbf{N}, \mathbf{N})
$$

Symmetry property

$$
\begin{aligned}
& <\phi, F(\mathbf{U}, \mathbf{V})>=-\frac{1}{8} \sum_{\mathrm{ijk} \ell} \mathrm{~A}_{\mathrm{k} \ell}^{\mathrm{ij}}\left(\varphi_{\mathrm{k}}+\varphi_{\ell}-\varphi_{\mathrm{i}}-\varphi_{\mathrm{j}}\right)\left(\mathrm{U}_{\mathrm{i}} \mathrm{~V}_{\mathrm{j}}+\mathrm{U}_{\mathrm{j}} \mathrm{~V}_{\mathrm{i}}\right) \\
& \phi=\left(\varphi_{1}, \varphi_{2}, \ldots, \varphi_{\mathrm{p}}\right) \in \mathrm{R}^{\mathrm{p}}
\end{aligned}
$$

Summational invariants: $\phi \in \mathrm{R}^{\mathrm{p}}$ such as

$$
\mathrm{A}_{\mathrm{ij}}^{\mathrm{k} \ell}\left(\varphi_{\mathrm{k}}+\varphi_{\ell}-\varphi_{\mathrm{i}}-\varphi_{\mathrm{j}}\right)=0 \quad \forall \mathrm{i}, \mathrm{j}, \mathrm{k}, \ell
$$

$\longrightarrow$ Linear subspace $\mathbf{F} \quad\left(\mathbf{F} \subset \mathrm{R}^{\mathrm{p}}\right.$ dimension of $\left.\mathbf{F}=\mathrm{q}\right)$
Base in $\mathbf{F}: \mathbf{V}^{1}, \mathbf{V}^{2}, \ldots \mathbf{V}^{\mathrm{q}}$
Base in $R^{p}: \mathbf{V}^{1}, \mathbf{V}^{2}, \ldots \mathbf{V}^{q}, \mathbf{W}^{q+1}, \ldots \mathbf{W}^{p}$
Kinetic densities

$$
\mathbf{N}=\sum_{\alpha=1}^{\alpha=q}{ }_{\alpha}^{a} V^{\alpha}+\sum_{\beta=q+1}^{\beta=p} b_{p} W^{\beta}
$$

Macrocospic variable Microscopic variable

$$
\frac{\partial}{\partial \mathrm{t}} \mathbf{N}+\mathcal{A} \mathbf{N}=\mathcal{F}(\mathbf{N}, \mathbf{N})
$$

Equations for the $\mathbf{a}_{\alpha}$ and the $\mathbf{b}_{\beta}$ variables

$$
\begin{aligned}
& \frac{\partial \mathbf{a}_{\alpha}}{\partial \mathrm{t}}+<\mathcal{A} \mathbf{N}, \mathbf{v}^{\alpha}>=0, \quad \alpha=1,2, \ldots, \mathrm{q} \quad \text { conservation laws } \\
& \frac{\partial \mathbf{b}_{\beta}}{\partial \mathrm{t}}+<\mathcal{A} \mathbf{N}, \mathbf{w}^{\beta}>=<\mathcal{F}(\mathbf{N}, \mathbf{N}), \mathbf{w}^{\beta}>, \quad \beta=\mathrm{q}+1, \mathrm{q}+2, \ldots, \mathrm{p}
\end{aligned}
$$

$\underline{\mathrm{H}-\text { Theorem: }} \mathrm{H}$ is decreasing with $\mathrm{H}=\langle\mathbf{N}, \ln \mathcal{F}(\mathbf{N}, \mathbf{N})>$
Maxwellian state: $\quad \ln \mathbf{N} \in \mathbf{F} \Leftrightarrow \mathcal{F}(\mathbf{N}, \mathbf{N})=0 \Leftrightarrow \ln \mathbf{N}=\sum_{\alpha=1}^{\alpha=q} \mathbf{c}_{\alpha} \mathbf{V}^{\alpha}$
Euler equations associated with the model: Equations for the variables $\mathbf{a}_{\alpha}$ or equivalently for the $\mathbf{c}_{\alpha}$ variables

$$
\sum_{\delta=1}^{\delta=q} \frac{\partial^{2} \mathcal{L}\left(\mathbf{c}_{1}, \mathbf{c}_{2}, \ldots, \mathbf{c}_{\mathbf{q}}\right)}{\partial \mathbf{c}_{\alpha} \partial \mathbf{c}_{\delta}} \frac{\partial \mathbf{c}_{\delta}}{\partial t}+\sum_{\delta=1}^{\delta=9} \frac{\partial^{2} \mathcal{M}\left(\mathbf{c}_{1}, \mathbf{c}_{2}, \ldots, \mathbf{c}_{q}\right)}{\partial \mathbf{c}_{\alpha} \partial \mathbf{c}_{\delta}} \frac{\partial \mathbf{c}_{\delta}}{\partial \mathrm{x}}=0, \quad \alpha=1,2, \ldots, \mathrm{q}
$$

Two problems are present in discrete kinetic theory:

1. The existence of macrocospic variables other than mass, momentum and energy
2. The anisotropic character generally related to the discrete models

In order to reduce and possibly to eliminate them, multiple collisions are introduced and some symmetry properties on the models are adopted

## The multiple collisions

Ar - collision is a collision between r particles:

$$
\begin{gathered}
\overrightarrow{\mathrm{u}}_{\mathrm{i}_{1}}, \overrightarrow{\mathrm{u}}_{2}, \ldots, \overrightarrow{\mathrm{u}}_{\mathrm{i}_{\mathrm{r}}} \\
\text { Before the collision } \\
\mathrm{I}_{\mathrm{r}}=\left(\mathrm{i}_{1}, \mathrm{i}_{2}, \ldots, \mathrm{i}_{\mathrm{r}}\right)
\end{gathered}
$$

$$
\overrightarrow{\mathrm{u}}_{\mathrm{j}_{1}}, \overrightarrow{\mathrm{u}}_{\mathrm{j}_{2}}, \ldots, \overrightarrow{\mathrm{u}}_{\mathrm{j}_{\mathrm{r}}}
$$

After the collision

$$
\mathrm{J}_{\mathrm{r}}=\left(\mathrm{j}_{1}, \mathrm{j}_{2}, \ldots, \mathrm{j}_{\mathrm{r}}\right)
$$

Transition probability: $\quad A_{I_{r}}^{J_{r}}$
$\delta\left(k, I_{r}, J_{r}\right)$ is the algebraic number of particles «k$»$ created in the $r$ - collision $I_{r} \rightarrow J_{r}$
$\sum_{\mathrm{I}_{\mathrm{r}} \mathrm{J}_{\mathrm{r}}} \delta\left(\mathrm{k}, \mathrm{I}_{\mathrm{r}}, \mathrm{J}_{\mathrm{r}}\right) \mathrm{A}_{\mathrm{I}_{\mathrm{r}}}^{\mathrm{J}_{\mathrm{r}}} \mathrm{N}_{\mathrm{i}_{1}} \mathrm{~N}_{\mathrm{i}_{2}} \ldots . . \mathrm{N}_{\mathrm{i}_{\mathrm{r}}}$ is the algebraic number of particles «k » created in all the r - collisions (per unit time)

Kinetic equations with $\mathbf{r}$ - collisions ( $\mathrm{r}=2,3, \ldots, \mathrm{R}$ )

$$
\begin{array}{ll}
\frac{\partial}{\partial \mathrm{t}} \mathrm{~N}_{\mathrm{k}}+\overrightarrow{\mathrm{u}}_{\mathrm{k}} \cdot \vec{\nabla} \mathrm{~N}_{\mathrm{k}}=\frac{1}{2} \sum_{\mathrm{r}=2,3, \ldots, \mathrm{R}} \sum_{\mathrm{I}_{\mathrm{r}} \mathrm{~J}_{\mathrm{r}}} \delta\left(\mathrm{k}, \mathrm{I}_{\mathrm{r}}, \mathrm{~J}_{\mathrm{r}}\right) \mathrm{A}_{\mathrm{I}_{\mathrm{r}}}^{\mathrm{J}_{\mathrm{r}}} \mathrm{~N}_{\mathrm{i}_{1}} \mathrm{~N}_{\mathrm{i}_{2}} \ldots . . \mathrm{N}_{\mathrm{i}_{\mathrm{r}}} \\
\mathrm{k}=1,2, \ldots, \mathrm{p} & \frac{\partial}{\partial \mathrm{t}} \mathbf{N}+\mathcal{A} \mathbf{N}=C(\mathbf{N})
\end{array}
$$

Summational invariants $\phi=\left(\varphi_{1}, \varphi_{2}, \ldots, \varphi_{p}\right) \in R^{p}$

$$
\mathrm{A}_{\mathrm{I}_{\mathrm{r}}}^{\mathrm{J}_{\mathrm{r}}} \sum_{\mathrm{k}} \delta\left(\mathrm{k}, \mathrm{I}_{\mathrm{r}}, \mathrm{~J}_{\mathrm{r}}\right) \varphi_{\mathrm{k}}=0 \quad \forall \mathrm{I}_{\mathrm{r}}, \mathrm{~J}_{\mathrm{r}}, \mathrm{r}
$$

$\Longrightarrow \quad$ Linear subspace $\quad \mathrm{F} \quad\left(\mathrm{F} \subset \mathrm{R}^{\mathrm{p}}\right)$
Two remarks
$>$ By taking into account multiple collisions, the dimension of $\mathbf{F}$ is decreasing
$>$ By taking into account all the r - collisions, it is possible to find the dimension of $\mathbf{F}$, without explicitly determining all the collisions between the particles (Ph. Chauvat)

## Examples: Dimension of $F$ is $\mathbf{4}$ or 5

Spatial models related to the cube

Velocity number
6 •
8
14 ••
$26 \cdot \cdot$

Coplanar models related to the hexagonal lattice

Generalizations

$$
\begin{aligned}
& \overrightarrow{\mathrm{u}}_{\mathrm{k}}=\mathrm{a}_{\mathrm{k}} \overrightarrow{\mathrm{I}}+\mathrm{b}_{\mathrm{k}} \overrightarrow{\mathrm{~J}}+\mathrm{c}_{\mathrm{k}} \overrightarrow{\mathrm{~K}}, \\
& \left(\mathrm{a}_{\mathrm{k}}, \mathrm{~b}_{\mathrm{k}}, \mathrm{c}_{\mathrm{k}}\right) \in \mathrm{Z}^{3} \\
& \operatorname{dim} \mathbf{F}=5
\end{aligned}
$$

## Chapman - Enskog expansion

$$
\frac{\partial}{\partial \mathrm{t}} \mathbf{N}+\mathcal{A} \mathbf{N}=\frac{1}{\varepsilon} C(\mathbf{N}, \mathbf{N}) \quad \varepsilon \ll 1 \quad(\varepsilon \text { Knudsen number })
$$

But: To obtain balance laws for the variables $\mathbf{a}_{\alpha}$

$$
\left\{\frac{\partial \mathbf{a}_{\alpha}}{\partial \mathrm{t}}+<\mathcal{A} \mathbf{N}, \mathbf{v}^{\alpha}>=0, \quad \alpha=1,2, \ldots, \mathrm{q}\right.
$$

with $\mathbf{N}=\mathbf{N}\left(\mathbf{a}_{\alpha}, \mathbf{b}_{\beta}\right)$, the variables $\mathbf{b}_{\beta}$ depending on the $\mathbf{a}_{\alpha}$
Chapman - Enskog expansion
$\mathbf{N}=\mathbf{N}^{(0)}+\varepsilon \mathbf{N}^{(1)}+\varepsilon^{2} \mathbf{N}^{(2)}+\cdots$
$C\left(\mathbf{N}^{(0)}, \mathbf{N}^{(0)}\right)=0$
$\mathbf{N}^{(0)}$ Maxwellian densities
Euler equations for $\mathbf{a}_{\alpha}$
$\mathcal{H}^{(1)}\left(\mathbf{N}^{(1)}\right)=\frac{\partial}{\partial \mathrm{t}} \mathbf{N}^{(0)}+\mathcal{A} \mathbf{N}^{(0)}$
Linearized collision operator
$\mathbf{N}^{(0)}+\varepsilon \mathbf{N}^{(1)} \quad$ Navier - Stokes equations for $\mathbf{a}_{\alpha}$

## 3. Hydrodynamical description for regular discrete models

## Regular discrete models

The successful simulations undertaken with the lattice gas method introduced by Frisch, Hasslacher and Pomeau, ... have provided a new light on the discrete models of gas
" Quasi - isotropic " models (Chauvat, Coulouvrat, R.G.)

$$
\begin{aligned}
& \mathcal{V}_{\ell}=\left\{\overrightarrow{\mathrm{u}}_{\mathrm{k}}^{\ell},\left|\overrightarrow{\mathrm{u}}_{\mathrm{k}}^{\ell}\right|=\mathrm{c}_{\ell}, \mathrm{k}=1,2, \ldots, \mathrm{p}_{\ell}\right\} \\
& \mathcal{U}=\left\{\overrightarrow{\mathrm{u}}_{\mathrm{k}}, \mathrm{k}=1,2, \ldots, \mathrm{p}\right\}=\cup_{\ell=1}^{\ell=\mathrm{L}} \mathcal{U}_{\ell}
\end{aligned}
$$

Mean properties
$+G$ : Isometry group in $\mathrm{R}^{\mathrm{D}}$
$+\quad \mathrm{g}(\mathcal{U})=\mathcal{U} \quad \forall \mathrm{g} \in \mathcal{G}$
$+\operatorname{dim} \mathrm{F}=\mathrm{D}+2 \quad$ (The multiple collisions are introduced)
Examples: Coplanar models related to the hexagonal lattice, Spatial models related to the cubic lattice

## Hydrodynamical description of the gas

Maxwellian state $\quad \mathrm{N}_{\mathrm{k}}^{(0)}=\exp \left(\alpha+\vec{\beta} \cdot \overrightarrow{\mathrm{u}}_{\mathrm{k}}+\gamma\left(\overrightarrow{\mathrm{u}}_{\mathrm{k}}^{2}-\mathrm{a}^{2}\right)\right)$

$$
\begin{gathered}
\mathrm{n}=\sum_{\mathrm{k}} \mathrm{~N}_{\mathrm{k}}^{(0)}, \quad \mathrm{n} \overrightarrow{\mathrm{u}}=\sum_{\mathrm{k}} \mathrm{~N}_{\mathrm{k}}^{(0)} \overrightarrow{\mathrm{u}}_{\mathrm{k}}, \quad \mathrm{ne}=\frac{1}{2} \sum_{\mathrm{k}} \mathrm{~N}_{\mathrm{k}}^{(0)} \overrightarrow{\mathrm{u}}_{\mathrm{k}}^{2} \\
\alpha, \vec{\beta}, \gamma \Leftrightarrow \mathrm{n}, \overrightarrow{\mathrm{u}}, \mathrm{e} \quad \text { Bijection }
\end{gathered}
$$

Homogeneous Maxwellian state $\quad N_{k}^{(0)}=\frac{n}{p} \quad\left(\overrightarrow{\mathrm{u}}=0, \mathrm{e}=\frac{1}{2} \mathrm{a}^{2}\right)$
Quasi - homogeneous Maxwellian state $\quad \Delta \mathrm{e} / \mathrm{a}^{2} \ll 1, \quad|\overrightarrow{\mathrm{u}}| / \mathrm{a} \ll 1$

$$
\begin{aligned}
N_{k}^{(0)}= & \frac{n}{p}\left\{1+\frac{D}{a^{2}} \overrightarrow{\mathrm{u}} \cdot \overrightarrow{\mathrm{u}}_{\mathrm{k}}+\frac{2\left(\overrightarrow{\mathrm{u}}_{\mathrm{k}}^{2}-\mathrm{a}^{2}\right)}{\mathrm{a}_{2}^{4}-\mathrm{a}^{4}}\left(\mathrm{e}-\frac{\mathrm{a}^{2}}{2}\right)+\frac{D^{2}}{2 \mathrm{a}^{4}}\left(\overrightarrow{\mathrm{u}}_{\mathrm{k}} \overrightarrow{\mathrm{u}}_{\mathrm{k}}-\frac{\overrightarrow{\mathrm{u}}_{\mathrm{k}}^{2}}{\mathrm{D}} \overrightarrow{\overrightarrow{\mathrm{I}}}\right): \overrightarrow{\mathrm{u}} \overrightarrow{\mathrm{u}}\right. \\
& \left.+\frac{2 \mathrm{D}^{2}}{\mathrm{a}^{2}}\left(\frac{\overrightarrow{\mathrm{u}}_{\mathrm{k}}^{2}-\mathrm{a}^{2}}{\mathrm{a}_{2}^{4}-\mathrm{a}^{4}}-\frac{1}{\mathrm{a}^{2}}\right)\left(\mathrm{e}-\frac{\mathrm{a}^{2}}{2}\right)\left(\overrightarrow{\mathrm{u}} \cdot \overrightarrow{\mathrm{u}}_{\mathrm{k}}\right)\right\}
\end{aligned}
$$

Notations: $\quad a_{r}=\left(\frac{1}{p} \sum_{k}\left|\vec{u}_{k}\right|^{2 r}\right)^{1 / 2 r} \quad a_{1}=\left(\frac{1}{p} \sum_{k}\left|\vec{u}_{k}\right|^{2}\right)^{1 / 2} \equiv a$

## Euler equations associated with the model

$$
\begin{aligned}
& \int \frac{\partial \rho}{\partial \mathrm{t}}+\vec{\nabla} \cdot(\rho \overrightarrow{\mathrm{u}})=0
\end{aligned}
$$

$$
\begin{aligned}
& \eta=\frac{a_{2}^{4}}{a^{4}} \frac{D}{D+2} \\
& \varphi=\frac{2 a_{2}^{8}-a^{4} a_{2}^{4}-a^{2} a_{3}^{6}}{a^{4}\left(a_{2}^{4}-a^{4}\right)}
\end{aligned}
$$

$\eta$ and depend on the discrete models
Continuous fluids $\eta=1 \quad \varphi=0$
Remarks: We can provide equivalent forms of the Euler equations; for example with a pressure tensor not necessarily spherical or a vector heat flux not necessarily zero

## Navier -Stokes equations associated with the model

$$
\begin{aligned}
& \frac{\partial \rho}{\partial \mathrm{t}}+\vec{\nabla} \cdot(\rho \overrightarrow{\mathrm{u}})=0 \\
& \frac{\partial(\rho \overrightarrow{\mathrm{u}})}{\partial \mathrm{t}}+\eta_{\theta_{0}}^{\vec{\nabla}} \cdot(\rho \overrightarrow{\mathrm{u}} \overrightarrow{\mathrm{u}})+\vec{\nabla} \bar{\sigma}=\left(\eta_{0}-1\right)^{\circ} \vec{\nabla}\left(\rho \frac{\overrightarrow{\mathrm{u}}^{2}}{\mathrm{D}}\right)+\vec{\nabla} \cdot\left(\rho \overrightarrow{\mathrm{M}}_{\mathrm{an}}\right) \\
& +\vec{\nabla} \cdot\left(2 \mu \overrightarrow{\overrightarrow{\mathrm{D}}}+\lambda \operatorname{Tr}(\overrightarrow{\mathrm{D}}) \overrightarrow{\mathrm{I}}_{\mathrm{D}}\right)+\vec{\nabla} \cdot \overrightarrow{\mathrm{B}}_{\mathrm{an}} \\
& \frac{\partial}{\partial \mathrm{t}}\left(\rho \mathrm{e}+\rho \frac{\overrightarrow{\mathrm{u}}^{2}}{2}\right)+\eta \vec{\nabla} \cdot\left(\left(\rho \mathrm{e}+\rho \frac{\overrightarrow{\mathrm{u}}^{2}}{2}+\Phi\right) \overrightarrow{\mathrm{u}}\right)=\stackrel{\rightharpoonup}{\nabla} \cdot\left(\rho\left(\mathrm{e}-\rho \frac{\mathrm{a}^{2}}{2}\right) \overrightarrow{\mathrm{u}}\right) \\
& +\vec{\nabla} \cdot(\kappa \vec{\nabla} \mathrm{e}) \\
& \mu \cong \frac{\rho}{(\mathrm{D}+2) \mathrm{a}^{2}} \frac{1}{\mathrm{~L}} \sum_{\ell=1,2, \ldots, \mathrm{~L}} \beta_{\ell} \mathrm{a}_{\ell}^{4}, \quad 2 \mu+\mathrm{D} \lambda=0, \quad \kappa \cong \frac{\rho}{\mathrm{D} \mathrm{a}^{2}} \frac{1}{\mathrm{~L}} \sum_{\ell=1,2, \ldots, \mathrm{~L}} \delta_{\ell} \mathrm{a}_{\ell}^{4}
\end{aligned}
$$

Remarks: $\quad \sum_{k} \overrightarrow{\mathrm{u}}_{\mathrm{k}} \overrightarrow{\mathrm{u}}_{\mathrm{k}} \overrightarrow{\mathrm{u}}_{\mathrm{k}} \overrightarrow{\mathrm{u}}_{\mathrm{k}}$ isotropic $\longrightarrow \overrightarrow{\overrightarrow{\mathrm{M}}}_{\mathrm{an}}=0 \quad \overrightarrow{\vec{B}}_{\mathrm{an}}=0$

## Numerical results for the transport coefficients

| Model | $\bar{\mu}$ | $\bar{\kappa}$ | Pr | $\kappa=\frac{\mathrm{ma}}{\mathrm{~S} \sqrt{2}} \bar{\kappa}$ |
| :---: | :---: | :---: | :---: | :---: |
| I | 0.15 | 0.24 | 0.62 |  |
| II | 0.24 | 0.33 | 0.73 |  |
| III | 0.22 | 0.24 | 0.92 | $\operatorname{Pr}=\frac{\mu}{\kappa}$ |
| IV | 0.25 | 0.41 | 0.61 |  |
| Chauvat (1989)* | 0.14 | 0.50 | 0.28 | * model I ( $\eta=0.67, \varphi=0$ |
| Chahine (1967)** | 0.14 | 0.56 | 0.25 | ** coplanar continuous model |

Models: I (12)

II (12)

III (18)

IV (18)
4. Boundary Conditions

## Boundary conditions on an impermeable wall (R.G., 1975)

$$
\left|\left(\overrightarrow{\mathrm{u}}_{\mathrm{r}}-\overrightarrow{\mathrm{u}}_{\mathrm{w}}\right) \cdot \overrightarrow{\mathrm{n}}\right| \mathrm{N}_{\mathrm{r}}=\sum_{\mathrm{i} \in \mathrm{I}} \mathrm{~B}_{\mathrm{ir}}\left|\left(\overrightarrow{\mathrm{u}}_{\mathrm{i}}-\overrightarrow{\mathrm{u}}_{\mathrm{w}}\right) \cdot \overrightarrow{\mathrm{n}}\right| \mathrm{N}_{\mathrm{i}} \quad \forall \mathrm{r} \in \mathrm{R}
$$

$B_{i r}$ : probability for a particle of velocity $\overrightarrow{\mathrm{u}}_{\mathrm{i}}$ impinging the wall, to be reflected with the velocity $\overrightarrow{\mathrm{u}}_{\mathrm{r}}$
H-Theorem in a vessel
Particular case of the diffuse reflexion: $\quad N_{r}=\lambda N_{r w}$
The densities $\mathrm{N}_{\text {rw }}$ are Maxwellian densities associated with the macroscopic variables of the wall $\mathrm{n}_{\mathrm{w}}=1, \overrightarrow{\mathrm{u}}_{\mathrm{w}}, \mathrm{T}_{\mathrm{w}}, \ldots$
$\lambda$ (as $n$ ) is unknown; $\lambda$ is known when the problem is solved

Gas in Maxwellian equilibrium with the condensed phase

$$
\begin{aligned}
& \mathrm{N}_{\mathrm{kw}}=\exp \left(\alpha+\vec{\beta} \cdot \overrightarrow{\mathrm{u}}_{\mathrm{k}}+\gamma\left|\overrightarrow{\mathrm{u}}_{\mathrm{k}}\right|^{2}\right) \\
& \sum_{\mathrm{k}} \mathrm{~N}_{\mathrm{kw}}=1, \quad \sum_{\mathrm{k}} \mathrm{~N}_{\mathrm{kw}} \overrightarrow{\mathrm{u}}_{\mathrm{k}}=0, \quad \frac{1}{2} \sum_{\mathrm{k}} \mathrm{~N}_{\mathrm{k}}\left(\overrightarrow{\mathrm{u}}_{\mathrm{k}}-\overrightarrow{\mathrm{u}}\right)^{2}=\frac{3}{2} \frac{\mathrm{kT}_{\mathrm{w}}}{\mathrm{~m}}
\end{aligned}
$$

Boundary conditions for the vapor

$$
\mathrm{N}_{\mathrm{r}}=\mathrm{n}_{\mathrm{sat}} \mathrm{~N}_{\mathrm{rw}}, \quad \forall \mathrm{r} \in \mathrm{R}
$$

$\mathrm{n}_{\text {sat }}$ : saturation density of the vapor at the temperature $\mathrm{T}_{\mathrm{w}}$
Remark: This boundary condition is valid only when the models are symmetrical about the normal $\overrightarrow{\mathrm{n}}$. This condition is similar to that of the continuous kinetic theory

## 5. Applications

## Applications

> Shock wave structure
> Unsteady and steady Couette flows (Knudsen layer, initial layer, ...)
> Flow and heat transfer between two parallel plates
$>$ Evaporation / condensation between two interfacex (temperature inversion)
$>$ Evaporation or condensation on a liquid interface
$>$ Flow in a microchannel

Flow and heat transfer between two parallel plates (d'Almeida)

Blue line: Thermophoresis phenomenon

Temperature
$\mathrm{T}_{\mathrm{w}}^{+}=2, \mathrm{u}_{\mathrm{w}}^{+}=0.2$

Evaporation / condensation between two interfaces (d'Almeida)

## Evaporation or condensation on a liquid interface (Nicodin)

These problems depend on 3 parameters : $\frac{\theta_{\infty}}{\theta_{0}}, v_{\infty}, M_{\infty}=\frac{\left|\omega_{\infty}\right|}{\sqrt{\theta_{\infty}}}>0$
The results obtained with a very simple model ( 16 velocities only) are in very good agreement with those of Sone, Aoki and their collaborators with continuous theory

## Condensation problem (Nicodin)

There is a Knudsen layer near the condensed phase $(\eta=0)$. A compression wave (shock wave) propagates to infinity

## Evaporation problem (Nicodin)

$\frac{\theta_{\infty}}{\theta_{0}}=1, \quad v_{\infty}=0.01, \mathrm{M}_{\infty}=1$

6. Conclusion

## Conclusion

## Many generalizations

Gas mixtures (Cercignani, Cornille, ...)
Chemical reactions (Pandolfi, ...)
Numerical approaches (Leguillon, Teman, Golstein, ...)
Semi discrete Boltzmann equation (Cabannes, Toscani, ...)

Many mathematical papers
Existence theorems, exact solutions, asymptotic analysis, ...
Cabannes, Bardos, Beale, Bellomo, Bobylev, Bony, Cercignani, Cornille, Godunov, Golse, Hamdache, Illner, Kawashimha, Levermore, Nishida, Platkowski, Sultangazin, Tartar, Vedenyapin, ...
