Equivalent notions of the Haagerup property

Introduction

HAP for vor Neumann algebras

HAP for arbitrary von Neumann algebras

Equivalen notions

Quantum groups A group G has the Haagerup property if:

- There exists a net of positive definite normalized functions in $C_0(G)$ converging to 1 uniformly on compacta
- G admits a proper affine action on a Hilbert space
- There exists a proper, conditionally negative function on G

Examples

Introduction

HAP for vor Neumann algebras

HAP for arbitrary von Neumann algebras

Equivalen notions

Quantum groups

- Amenable groups
- *F_n* (Haagerup, '78/'79)
- *SL*(2, ℤ)
- Haagerup property + Property (T) implies compactness

HAP for von Neumann algebras

Introduction

HAP for von Neumann algebras

HAP for arbitrary von Neumann algebras

Equivalen notions

Quantun groups

Definition Haagerup property (Choda '83, Jolissaint '02)

A finite von Neumann algebra (M, τ) has HAP if there exists a net $(\Phi_i)_i$ of normal cp maps $\Phi_i : M \to M$ such that:

- $au au \circ \Phi_i \leq au$
- The map $T_i: x\Omega_{\tau} \mapsto \Phi_i(x)\Omega_{\tau}$ is compact
- $allet T_i o 1$ strongly

Remark:

■ In the definition (M, τ) has HAP than Φ_i 's can be chosen unital and such that $\tau \circ \Phi_i = \tau$.

HAP for groups versus HAP for vNA's

Introductio

HAP for von Neumann algebras

HAP for arbitrary von Neumann algebras

Equivalen notions

Quantum groups

Theorem (Choda '83)

A discrete group G has HAP \Leftrightarrow The group von Neumann algebra $\mathcal{L}(G)$ has HAP

Idea of the proof: (Haagerup)

- $\Rightarrow \varphi_i$ the positive definite functions $\Rightarrow \Phi_i : \mathcal{L}(G) \to \mathcal{L}(G) : \lambda(f) \mapsto \lambda(\varphi_i f)$.
- $\leftarrow \Phi_i$ cp maps \Rightarrow use the 'averaging technique':

$$\varphi_i(s) = \tau(\lambda(s)^* \Phi_i(\lambda(s)).$$

HAP for von Neumann algebras

Introduction

HAP for von Neumann algebras

HAP for arbitrary von Neumann algebras

Equivalen notions

Quantum groups

Definition Haagerup property

A σ -finite von Neumann algebra (M, φ) has HAP if there exists a net $(\Phi_i)_i$ of normal op maps $\Phi_i : M \to M$ such that:

- $\varphi \circ \Phi_i \leq \varphi$
- The map $T_i : x\Omega_{\varphi} \mapsto \Phi_i(x)\Omega_{\varphi}$ is compact
- $extbf{T}_i o 1$ strongly

HAP for von Neumann algebras

Introduction

HAP for vol Neumann algebras

HAP for arbitrary von Neumann algebras

Equivalen notions

Quantum groups

Definition Haagerup property (MC, Skalski)

An arbitrary von Neumann algebra (M, φ) with nsf weight φ has HAP if there exists a net $(\Phi_i)_i$ of normal cp maps $\Phi_i : M \to M$ such that:

- $\varphi \circ \Phi_i \leq \varphi$
- The map $T_i : \Lambda_{\varphi}(x) \mapsto \Lambda_{\varphi}(\Phi_i(x))$ is compact
- \blacksquare $T_i \rightarrow 1$ strongly

Remark:

In our approach it is essential to treat weights instead of states.

Motivating examples

Introduction

HAP for vor Neumann algebras

HAP for arbitrary von Neumann algebras

Equivalent notions

Quantum groups ■ Brannan '12: Free orthogonal and free unitary quantum groups have HAP.
Kac case ⇒ Semi-finite.

Let α be any action of a group G on M.

- If $M \rtimes_{\alpha} G$ has HAP then so has M
- If M has HAP and G amenable then $M \rtimes_{\alpha} G$ has HAP

Crossed products

ntroduction

HAP for voi Neumann algebras

HAP for arbitrary von Neumann algebras

Equivalen notions

Quantum groups

Consequence

Let α be any action of a group G on M.

- If $M \rtimes_{\alpha} G$ has HAP then so has M
- If M has HAP and G amenable then $M \rtimes_{\alpha} G$ has HAP

Comments:

- $M \rtimes_{\alpha} G$ has HAP implies that G has HAP in case G discrete
- $\mathbb{Z}^2 \rtimes SL(2,\mathbb{Z})$ does not have HAP whereas $SL(2,\mathbb{Z})$ has HAP and is weakly amenable

Markov property

Introductior

HAP for voi Neumann algebras

HAP for arbitrary von Neumann algebras

Equivalen notions

Quantum groups Let M be a von Neumann algebra with normal state φ . We say that a normal map $\Phi: M \to M$ is M if it is a ucp φ -preserving map.

Theorem (MC, A. Skalski)

The following are equivalent:

- \blacksquare (M, φ) has HAP
- \blacksquare (M, φ) has HAP and the cp maps Φ_i are Markov

Corollary: If (M_1, φ_1) and (M_2, φ_2) have HAP then so does the free product $(M_1 \star M_2, \varphi_1 \star \varphi_2)$. (following Boca '93).

Modular HAP

Introductio

HAP for vor Neumann algebras

HAP for arbitrary von Neumann algebras

Equivalen notions

Quantum groups We say that (M,φ) has the modular HAP if the cp maps Φ_i commute with $\sigma_t, t \in \mathbb{R}$.

Theorem (MC, Skalski)

 $({\it M},\varphi)$ is the von Neumann algebra of a compact quantum group with Haar state $\varphi.$ TFAE:

- \blacksquare (M,φ) has HAP
- \blacksquare (M, φ) has the modular HAP

Definition

Let $(\Phi_t)_{t\geq 0}$ be a semigroup of cp maps on M. $(\Phi_t)_{t\geq 0}$ is called Markov if $\Phi_t, t\geq 0$ is Markov. It is called KMS-symmetric if $T_t: D_{\varphi}^{\frac{1}{4}} x D_{\varphi}^{\frac{1}{4}} \mapsto D_{\varphi}^{\frac{1}{4}} x D_{\varphi}^{\frac{1}{4}}$ is self-adjoint. It is called immediately L^2 -compact if $T_t, t>0$ is compact.

Theorem: HAP via Markov semigroups (MC, Skalski)

M von Neumann algebra with normal state φ . TFAE:

- \blacksquare (M, φ) has HAP.
- There exists an immediately L^2 -compact KMS-symmetric Markov semigroup $(\Phi_t)_{t\geq 0}$ on M.

Comment: Proof via symmetric HAP + ideas of Jolissaint-Martin '04/Cipriani Sauvageot '03.

The next result is the non-commutative analogue of the existence of a proper conditionally negative definite function on a discrete group. ⇒ quadratic form: 'quantum Dirichlet form'.
